Research and Teaching Interests

Janssen's research focuses on the interactions of behavior, institutions and the environment. He is interested how to find solutions to sustainability challenges especially related to the governance of common resources. His main applications include irrigation systems, ground water management and coupled infrastructure systems. He mainly uses computational models, like agent-based models, in combination with laboratory experiments, surveys, case study analysis and stakeholder workshops. His teaching focuses on agent-based modelling, the use of games for sustainability, and institutional analysis.
